Page 66, line 12-: replace first \mathcal{S} by X

Page 70, line 7-: add “ $0 <$ ” before “ $|p - x|$ ”

Page 76, line 2-: add “nonempty” before “Polish”

Page 77, line 1: Delete “Assume that $X \neq \emptyset$ and”; capitalize “fix”

Page 78, 12.17: After “Theorem.” add “(Dixmier)”

Page 84, line 2: $x_n \in A_n \rightarrow x_n \in A_{x|n}$

Page 86, line 7: delete “additionally”

Page 89, 15.1: Ronnie Chen (see the note rynchn.github.io/math/lusin-suslin.pdf) found recently the following simple proof of Theorem 15.1:

By a change of topology, we can assume that $A = X$. Let \mathcal{U} be a countable basis of open sets in X . For each $U \in \mathcal{U}$, since f is injective, $f(U), f(X \setminus U) \subseteq Y$ are disjoint, so by the Lusin Separation Theorem 14.7, there is a Borel set $B_U \subseteq Y$ such that $f(U) \subseteq B_U \subseteq Y \setminus f(X \setminus U)$, i.e., $U = f^{-1}(B_U)$. Let Y' be Y with a finer Polish topology making each B_U open (and $\mathbf{B}(Y') = \mathbf{B}(Y)$), and let X' be X with $f^{-1}(V)$ adjoined to its topology for each open $V \subseteq Y'$. Then X' is Polish (since $X' \cong X \times_Y Y'$), and $f : X' \rightarrow Y'$ is an embedding, so $f(X) = f(X') \in \Pi_2^0(Y') \subseteq \mathbf{B}(Y)$.

Page 111, line 4-: replace second $\overline{\lim}$ by $\overline{\lim}_n$

Page 117, 17.44, line 3: replace “ $\forall a_n$ ” by “ $\bigvee a_n$ ”

Page 117, 17.44, line 4: replace “ A .” by “ A , where $\bigvee a_n$ is the least upper bound of $\{a_n : n \in \mathbb{N}\}$, also called the **join** of (a_n) ”

Page 120, line 9: delete “here” after “interest”

Page 122, 18.6: In the second paragraph of the proof, add after “We will show that it is Borel.” the sentence: “Clearly the domain of f , $\text{proj}_X(P)$, is Borel, since $x \in \text{proj}_X(P) \Leftrightarrow P_x \notin I_x$.”

One can also formulate a stronger version of this theorem as follows:

Theorem 18.6*. *Let X, Y be standard Borel spaces and $P \subseteq X \times Y$ be Borel with $A = \text{proj}_X(P) \subseteq X$. Let $x \in A \mapsto I_x$ be a map assigning to each $x \in A$ a σ -ideal of subsets of P_x such that:*

(i) For each Borel $R \subseteq P$, there is a Σ_1^1 set $S \subseteq X$ and a Π_1^1 set $T \subseteq X$ such that

$$x \in A \Rightarrow [R_x \in I_x \Leftrightarrow x \in S \Leftrightarrow x \in T],$$

(ii) $x \in A \Rightarrow P_x \notin I_x$.

Then there is a Borel uniformization of P , and in particular A is Borel.

Proof. Using the same notation as in the proof of 18.6, define $f: A \rightarrow Y$ exactly as before. We will check that the graph of f is Borel. Indeed we have:

$$f(x) = y \Leftrightarrow (x, y) \in P \ \& \ \forall n \exists s \in \mathbb{N}^n [P_x^s \notin I_x \ \& \ \forall t <_{\text{lex}} s (P_x^t \in I_x) \ \& \ y \in P_x^s],$$

which by (i) above is both Σ_1^1 and Π_1^1 , thus Borel. \square

Page 213: Replace the first paragraph of 27.D by the following:

“Consider now the relation of isomorphism \cong between elements of X_L , $L = \{R\}$, R binary, i.e.,

$$x \cong y \Leftrightarrow \mathcal{A}_x \cong \mathcal{A}_y.$$

It is clearly Σ_1^1 (in $X_L \times X_L$). It was shown by H. Friedman and L. Stanley [1989] that it is Σ_1^1 -complete, even restricted to LO. Their proof used methods of effective descriptive set theory, which we do not develop here. An alternative proof based only on 27.12 was later found by R. Dougherty.”

Also replace “To see that \cong is not Borel,” in the second paragraph of 27.D by “One can also give a different (and simpler) proof, using a result

from Section 31, that \cong on LO is not Borel (which also implies, using Σ_1^1 -Detereminacy, that it is Σ_1^1 -complete). To see this”

Page 216, line 3: Peter Komjath pointed out that this result has been earlier proved in B.S. Sodnomov, On arithmetical sums of sets, *Doklady Akad. Nauk SSSR (N.S.)*, **80** (1951), 173–175. See also B.S. Sodnomov, Example of two sets of type G_δ whose arithmetic sum is non-B-measurable, *Dokl. Akad. Nauk SSSR (N.S.)*, **99** (1954), 507–510.

Page 364: after **27.10** add:

27.D. Dougherty (private communication) has found another proof, avoiding methods of effective descriptive set theory, that \cong on LO is Σ_1^1 -complete. It goes as follows:

The set of linear orderings which are not well-orderings is Σ_1^1 -complete (see 27.12), so it suffices to produce two Borel maps A, B from LO to LO such that x is not a wellordering iff $A(x)$ is isomorphic to $B(x)$.

For a linear ordering \mathcal{L} , let \mathcal{L}^* be the set of finite strictly decreasing sequences from \mathcal{L} , ordered lexicographically. Note that there is always a least member of \mathcal{L}^* , namely the empty sequence (when we refer to an element of a structure we of course mean an element of its universe).

Claim 1. $\mathcal{L}^* \times \mathcal{M}^*$ is isomorphic to $(\mathcal{L} + \mathcal{M})^*$ (where \times refers to multiplication and $+$ to addition of linear orderings).

Proof. If $s \in \mathcal{L}^*$ and $t \in \mathcal{M}^*$, then the concatenation of t, s is in $(\mathcal{L} + \mathcal{M})^*$; it is easy to check that this gives an order-preserving bijection from $\mathcal{L}^* \times \mathcal{M}^*$ to $(\mathcal{L} + \mathcal{M})^*$.

Claim 2. If \mathcal{L} is a wellordering, then \mathcal{L}^* is a well-ordering.

Proof. Suppose not; say we have an infinite decreasing sequence of members of \mathcal{L}^* . Since \mathcal{L} is a wellordering, the first coordinates of these sequences must eventually stabilize; then the second coordinates must reach a limiting value, and so on. Thus this sequence of limiting values will be an infinite decreasing sequence in \mathcal{L} , a contradiction.

Claim 3. If \mathcal{L} is a countable linear ordering with no least element, then \mathcal{L}^* is isomorphic to $1 + \mathbb{Q}$.

Proof. It suffices to prove that \mathcal{L}^* is dense and has no greatest element (we already know it has a least element). Given $s \in \mathcal{L}^*$, choose $i \in \mathcal{L}$ less than all members of s ; then the concatenation of s with i is greater than s in \mathcal{L}^* . Now suppose that $s < t$ in \mathcal{L}^* . If t is an extension of s , let i be the first coordinate of t beyond s , and find $i' < i$ in \mathcal{L} ; then the concatenation of s, i' is between s and t in \mathcal{L}^* . If s and t disagree at some coordinate, find i in \mathcal{L} less than the last coordinate of s ; then the concatenation of s, i is between s and t in \mathcal{L}^* .

Now, if \mathcal{L} is a wellordering, then \mathcal{L}^* is a wellordering, so $\mathcal{L}^* + \mathcal{L}^*$ is not isomorphic to \mathcal{L}^* . If \mathcal{L} is countable but not a wellordering, let \mathcal{L}_1 be the maximal well-founded initial segment of \mathcal{L} ; then we have $\mathcal{L} \cong \mathcal{L}_1 + \mathcal{L}_2$, where \mathcal{L}_2 has no least element. We now have that \mathcal{L}^* is isomorphic to $\mathcal{L}_1^* \times (1 + \mathbb{Q})$;

since $1 + \mathbb{Q} + 1 + \mathbb{Q}$ is isomorphic to $1 + \mathbb{Q}$, $\mathcal{L}^* + \mathcal{L}^*$ is isomorphic to \mathcal{L}^* . (It could happen that \mathcal{L}_1 is empty, in which case $\mathcal{L}^* \cong 1 + \mathbb{Q}$.) Therefore, \mathcal{L} is not a wellordering iff $\mathcal{L}^* \cong (\mathcal{L}^* + \mathcal{L}^*)$. It is easy now to find Borel maps A, B from LO to LO such that for $x \in \text{LO}$, $\mathcal{A}_{A(x)} \cong (\mathcal{A}_x)^*$ and $\mathcal{A}_{B(x)} \cong ((\mathcal{A}_x)^* + (\mathcal{A}_x)^*)$, and the proof is complete.

Page 366, 35.29: Change ξ to θ . Then add:

Let now $B \subseteq \Psi^\infty(A)$ be in $\check{\Gamma}$. Then $C = \{(p_0, x) : x \in B\} \subseteq \mathcal{U}$ is in $\check{\Gamma}$. So there is $\xi < \delta_\Gamma$ with $\psi(p_0, x) < \xi$, for all $x \in B$. Thus $B \subseteq \Psi^\xi(A)$.

Remark. When Ψ is *in addition* $\check{\Gamma}$ on $\check{\Gamma}$ and $A \in \Gamma \cap \check{\Gamma}$, then the map that sends $x \in \Psi^\infty(A)$ to the least ordinal α such that $x \in \Psi^\alpha(A)$, is a Γ -rank on $\Psi^\infty(A)$. The proof is very similar to that of the *Stage Comparison Theorem* in Y.N. Moschovakis, *Elementary Induction on Abstract Structures*, Dover, 2008, Theorem 2A.2.

Page 367, 37.4: (R. Kaufman) replace “ $\exists w \in \text{WO} \dots w(f(s), f(t)) = 1$ ” by “ $\exists T \in \text{WF} \forall s(x \in P_s \Rightarrow s \in T)$ ”
